assertions

2/2 points (graded)

Consider this (incomplete) function:

```
/**
 * Solves quadratic equation  $ax^2 + bx + c = 0$ .
 *
 * @param a quadratic coefficient, requires  $a \neq 0$ 
 * @param b linear coefficient
 * @param c constant term
 * @return a list of the real roots of the equation
 */
public static List<Double> quadraticRoots(final int a, final int b, final int c) {
    List<Double> roots = new ArrayList<Double>();
    // A
    ... // compute roots
    // B
    return roots;
}
```

What statements would be reasonable to write at position A? Check all that apply.

☒ `assert a != 0;`

☐ `assert b != 0;`

☐ `assert c != 0;`

☐ `assert roots.size() >= 0;`

☐ `assert roots.size() <= 2;`

☐ `roots.forEach((x) -> { assert Math.abs(a*x*x + b*x + c) < 0.0001; });`

What statements would be reasonable to write at position B? Check all that apply.

☐ `assert a != 0;`

☐ `assert b != 0;`

☐ `assert c != 0;`

☐ `assert roots.size() >= 0;`

☒ `assert roots.size() <= 2;`

☒ `roots.forEach((x) -> { assert Math.abs(a*x*x + b*x + c) < 0.0001; });`

Note: `roots.forEach()` applies a lambda expression to each element of the `roots` list. Its rough equivalent in Python is:

```
map(lambda x: assert abs(a*x*x + b*x + c) < 0.0001, roots)
```

or:

```
for x in roots:  
    assert abs(a*x*x + b*x + c) < 0.0001
```

Explanation

It's good to assert `a != 0` at the start of the function, but not necessary to assert at the end of the function, since `final` prevents it from being changed.

It isn't correct to assert `b!=0` or `c!=0`, since 0 is a legal value for those parameters.

It isn't reasonable to assert `roots.size() >= 0` because lists are guaranteed to have nonnegative length. This assertion would only fail if the `List.size()` method were broken. Don't assert guaranteed behavior of the language or library.

A quadratic equation can have at most 2 roots, so it's reasonable to assert `roots.size() <= 2`.

It isn't reasonable to assert the content of the `roots` list until it has actually been computed -- i.e. not at the start of the function, but at the end of the function.
