persuasive safety-f 1. "Strings are imm		exposure	commer	nt?											
No ~	Answe	er: No													
2. " followers0f parameters and re							ts, but [getFollo	owers()	makes a	defensiv	e copy of	the Set	it retur	ns, and all othe
Yes 🗸	✓ Ans	swer: Yes													
3. "This class is mu	ıtable, so r	rep expo	sure isn't	an issue	."										
No 🗸	✓ Ans	wer: No													
4." followersOf	is a mut	table Ma	o, but it is	never p	assed or r	returned	from an (operation	."						
No ~	Answe	er: No													
5. " FollowGraph does not expose th		not expo	ose the re	p; addF	ollower	() does	s not exp	ose the re	p; remo	veFollo	wer()	does not (expose th	ie rep; g	etFollowers(
No 🗸	✓ Ans	wer: No													

6." String is immutable, and the Set objects in the rep are made immutable by unmodifiable wrappers. The Map type is mutable, but that type is never passed or returned from an operation."

Explanation

- 1. This is true, but insufficient, because the rep also contains mutable Map and Set objects.
- 2. This is a good argument. It considers each element of the rep (each private field, including all objects in the data structure that the field points to), and how each operation might affect it.
- 3. Immutability is not the only invariant that can be threatened by rep exposure. FollowsGraph has a rep invariant that can be threatened if a Set of followers is inadvertently shared with a client.
- 4. The Map is not the only mutable type in the rep.
- 5. Proof by repeated assertion is not an argument.
- 6. This is a good argument. It considers all the types in the rep, asks whether they are immutable or not, and whether there is a static guarantee (for Map and String) or a dynamic check (for Set) that protects them from rep exposure. One could ask which approach is more error-prone -- defensive copying, or making sure the sets stay unmodifiable internally -- but the safety argument is nevertheless sound.
