```
        public void run() { System.out.println( spinning );
    };
            });
            clotho.start();
            new Thread(new Runnable() {
                public void run() { System.out.println("measuring");
    };
            }).start();
            new Thread(new Runnable() {
                public void run() { System.out.println("cutting");
    };
            });
            // bug! never started
        }
    }
```

Which of the following are possible outputs from this program:

spinning
measuring
cutting

✅ **spinning**
**measuring**

measuring
spinning
cutting

✅ **measuring**
**spinning**

☐ spinning

measuring

✔

**Explanation**

The third thread is never started, so cutting will never be printed.

The order of the other outputs depends on whether the first thread runs println before or after the second.

**Submit**
